# EXPERIMENT - 08

**Aim**

To create storyboards representing the user flow of a mobile e-commerce application using Balsamiq.

**Introduction**

Storyboards are visual representations of how users interact with an application step by step. They help designers understand user behavior and improve navigation flow.

In this experiment, a storyboard is created for a mobile e-commerce application to represent the complete process of browsing products, selecting items, and completing a purchase. This helps in designing a user-friendly and efficient interface.

**Procedure (4 Steps)**

**Step 1: Define User Flow**

- Identified key screens such as Home, Categories, Product List, Product Details, Checkout, and Payment
- Analyzed how users move from one screen to another
- Planned the complete flow from product browsing to order confirmation

**Step 2: Create Wireframe Screens**

- Designed basic wireframes using simple shapes and UI components
- Used elements like search bar, buttons, product images, and navigation bar
- Ensured proper alignment, spacing, and readability
- Focused on simplicity to clearly represent the structure of the app

**Step 3: Design User Flow Screens**

The following screens were created:

**Home Screen**

- Includes search bar and product offers
- Displays categories and featured products
- Acts as the starting point for user interaction

**Categories Screen**

- Shows different product categories such as Apparel, Electronics, Kitchen, etc.
- Helps users easily navigate to desired products

**Product List Screen**

- Displays list of products with image, name, and price
- Includes “Add to Cart” button for each item
- Allows users to compare products

**Product Details Screen**

- Shows detailed information about a product
- Includes price, rating, description, and image
- Provides option to add product to cart

**Checkout Screen**

- Displays selected items and total amount
- Includes input field for delivery address
- Allows users to review order before payment

**Payment Screen**

- Shows different payment options like UPI, Card, COD
- Displays order summary and total cost
- Includes confirmation message after successful payment

**Step 4: Connect and Finalize Flow**

- Arranged all screens in sequence
- Connected screens to represent navigation flow
- Verified smooth user journey from start to end
- Ensured all steps are logically connected

**User Flow**

Home → Categories → Product List → Product Details → Checkout → Payment → Order Confirmation

**Result**

The storyboard successfully represents the complete user journey of an e-commerce application. It clearly shows how users interact with different screens and complete a purchase. This helps in improving usability, navigation, and overall user experience.
